

# Pressure independent balancing and control valve AB-QM DN 10-250

The AB-QM valve equipped with an actuator is a control valve with full authority and an automatic balancing function / flow limitation. Typical applications are: Temperature control with permanent automatic balancing on terminal units (chillers, air-handling units, fan coils, induction units, radiation panels and heat exchangers).

#### Description

The **precise flow control performance** of the AB-QM with a Danfoss actuator provides increased comfort and lower **Total Cost of Ownership** because of savings made on:

- Efficient energy transfer and minimal pumping costs since there are no overflows at partial loads because of the exact pressure independent flow limitation.
- Smaller pump investments and lower energy consumption as the pump head needed is lower than in the traditional setup. With the built in test plugs it is easy to troubleshoot and find the optimal setpoint for the pump.
- Reduced movements of the actuator since the built-in differential pressure controller ensure the pressure fluctuations do not influence the room temperature.
- Achieving a stable temperature in a room leading to a lower average temperature at the same comfort level.
- Minimal flow complaints, as the valve performs as designed.
- Minimal blockage complains, as the membrane design makes AB-QM less susceptible to blockage than a cartridge type construction.
- Trouble-free segmentation of the building

project. When sections of a project are finished they can normally not be handed over to the customer with a fully functional HVAC installation. However the AB-QM with a Danfoss actuator will automatically control the flow, even when other parts of the installation are still unfinished. It's not needed to adjust the AB-QM after finalisation of the project.

- Commissioning costs, the costs are close to zero because of a convenient setting procedure without the need for flow charts, calculations or measuring equipment. The AB-QM valves can be set to a precise design value even when the system is up and running.
- Halved mounting costs as the AB-QM valve covers two functions, Balancing & Control

## AB-QM DN 10-250

#### **Control performance**

Data sheet

The AB-QM has a linear control characteristic. The AB-QM is pressure independent which means that the control characteristic is independent from the available pressure and is not influenced by a low authority. The flow limitation on the AB-QM is achieved by limiting the stroke and the Danfoss actuators calibrate to the stroke of the valves. This means that the AB-QM keeps its linear characteristic independent of the setting or differential pressure.

Because of the predictable characteristic the actuators on the AB-QM can be used to change the response from linear to logarithmic (equal percentage). That makes the AB-QM suitable for all applications, including AHUs, where the equal percentage characteristic is needed to get a stable control loop. The actuators can be switched from linear to logarithmic by changing a DIP switch setting on the actuator.

Applications

- variable flow systems

An AB-QM with a Danfoss actuator is used as a control valve for terminal units, like an AHU (Air Handling Unit), FCU (Fan Coil Unit) or radiation panel. The AB-QM ensures and control the required flow on every terminal unit and maintains hydronic balance in the system.

Because of the integrated differential pressure controller the control valve always has 100 % authority and therefore offers always stable control. At partial load there is no overflow, contrary to conventional solutions, because the AB-QM will always limit the flow to exactly what is needed. By installing the AB-QM the whole system is divided in completely independent control loops.

There is a full range of Danfoss actuators available for the AB-QM, suitable for every control strategy. Actuators are available for On/Off, 0-10 Volt, 4-20 mA or floating point.

- constant flow systems

In constant flow system with FCUs or in a one pipe heating system the AB-QM can be installed as an automatic balancing valve in every riser. The AB-QM limits the flow to the set value, thus automatically achieving hydronic balance in the system.

There are numerous applications in which AB-QM can be used. Every time you need an automatic flow limiter or a control valve you can take advantage of the cost-saving properties of the AB-QM. That includes systems with (floor) heating/cooling, concrete core activation or radiation panels.

Note: For more application examples please contact your local Danfoss organization.

| Easy implementation | <ul> <li>No Kv or authority calculations needed. Flow is the only parameter to be considered when designing.</li> <li>The AB-QM always fits the application because the maximum setting of the AB-QM corresponds with international standards for flow velocity in pipes.</li> <li>The AB-QM can be used for all HVAC applications since it can have a linear or logarithmic characteristic when combined with thermal electric or gear actuators.</li> </ul> | <ul> <li>Easy commissioning. No specialized staff or measuring equipment needed.</li> <li>Easy trouble shooting.</li> <li>Fast start-up because AB-QM valves don't need to be flushed or de-aired before use.</li> <li>Trouble-free segmentation of the building project. The AB-QM will automatically control the flow, even when parts of the installation are still unfinished. It's not needed to adjust the AB-QM after finalisation of the building project.</li> </ul> |

|          |          | 1      |

Closing point (measure) for DN 10-32

<sup>1)</sup> Up to 70% of maximum flow for ½" and ¾" valves, 65% of maximum flow for 1" and 1¼" valves

ana 1% valves <sup>2)</sup> Requires **082F1072** adapter <sup>3)</sup> Requires **003Z3960** adapter <sup>4)</sup> Requires spacer **003Z0257** <sup>5)</sup> Cable needs to be ordered as separate

code nr. <sup>6)</sup> Feedback signal over field bus

| * Adapter required for 2nd gen valve.    |
|--|
| Part # 003Z0694                          |
| ** Available battery backup assembly for |

for safety function, AM-PBU25, 082H7090, one per four AME435 QM actuators

When used in plant Type II for DIN EN 14868 appropriate protective measures are taken. The requirements of VDI 2035, part 1 + 2 are observed. |       |            |         |             |                     |             |                     |         |                                |                  |                                      |  |

<sup>1)</sup> Factory setting of the valve is done at nominal setting range.

<sup>2)</sup> Regardless of the setting, the valve can modulate below 1 % of set flow.

<sup>3)</sup> When set above 100 %, minimum starting pressure needed is higher, see figures in the ().

Actuator with compatible stroke must be selected.
 At min differential pressure valve reaches at least 90% of nominal flow. Declaration of performance is available upon request.

According suitability and usage especially in not oxygen tight systems please mind the instructions given by the coolant producer.

- <sup>1)</sup> Factory setting of the valve is done at nominal setting range. 2)
- Regardless of the setting, the valve can modulate below 1% of set flow. When set above 100 %, minimum starting pressure needed is higher, see figures in the (). 3)
- 4) In case AB-QM is used above 400 kPa
- differential pressure contact Danfoss design center to assure proper
- At min differential pressure valve reaches at least 90% of nominal flow. Declaration of performance is available upon request.
- Pc pressure controller part
- Cv Control valve part

## Design

- 1. Spindle
- 2. Stuffing box
- Pointer
   Control
- 4. Control valve's cone
- 5. Membrane
- 6. Main spring7. Hollow cone (pressure)
- controller)
- 8. Vulcanized seat (pressure controller)

## Function:

The AB-QM valve consists of two parts:

- 1. Differential pressure controller
- 2. Control valve

#### 1. Shut off screw

- 2. Main spring
- 3. Membrane
- 4. DP cone
- 5. Seat
- 6. Valve body
- 7. Control valves cone
- 8. Locking screw
- 9. Scale
- 10. Stuffing box
- 11. Spindle

#### 1. Differential pressure controller DPC

The differential pressure controller maintains a constant differential pressure across the control valve. The pressure difference  $\Delta p_{cv}$  (P2-P3) on the membrane is balanced with the force of the spring. Whenever the differential pressure across the control valve changes (due to a change in available pressure, or movement of the control valve) the hollow cone is displaced to a new position which brings a new equilibrium and therefore keeps the differential pressure at a constant level.

#### 2. Control valve Cv

The control valve has a linear characteristic. It features a stroke limitation function that allows adjustment of the Kv value. The percentage marked on the scale equals the percentage of 100 % flow marked on the pointer. Changing the stroke limitation is done by lifting the blocking mechanism and turning the top of the valve to the desired position, showed on the scale as a percentage. A blocking mechanism automatically prevents unwanted changing of the setting.

Janfoss

#### AB-QM DN 10-250

## Sizing (continuous)

#### Example 1: Variable flow system

## <u>Given</u>:

Cool requirement per unit : 1000 W Flow temperature in the system: 6 °C Return temperature in the system: 12 °C

<u>Required - control and balancing valves:</u> AB-QM and actuators type for BMS system. <u>Solution:</u> Flow in the system: Q (I/h)  $Q = 0.86 \times 1000/(12-6) = 143 I/h$  Selected: AB-QM DN 10 mm with  $Q_{nom} = 275$  l/h presetting on 143/275 = 0.52 = 52 % of nominal opening. Actuators: AMV 110NL - 24 V <u>Remarks:</u> required minimum differential pressure across the AB-QM DN 10: 16 kPa.

## Example 2: Constant flow system

#### <u>Given:</u>

Cool requirement per unit : 4000 W Flow temperature in the system : 6 °C Return temperature in the system : 12 °C

## <u>Required - automatic flow limiter:</u> AB-QM and presetting.

<u>Solution:</u> Flow in the system : Q (I/h)  $Q = 0.86 \times 4000 / (12 - 6) = 573 I/h$ 

#### Selected: AB-QM DN 20 mm with $Q_{nom} = 900 \text{ l/h}$ presetting on 573/900 = 0.64 = 64 % of maximum opening.

<u>Remarks:</u> required minimum differential pressure across the AB-QM DN 20: 16 kPa.

#### Example 3: Sizing AB-QM according pipe dimension

#### Given:

Flow in system 1.4 m<sup>3</sup>/h (1400 l/h = 0.38 l/s), pipe dimension DN 25 mm

#### <u>Required - automatic flow limiter:</u> AB-QM and presetting.

<u>Solution:</u>

In this case we can selected AB-QM DN 25 mm with  $\rm Q_{nom}$  = 1700 l/h

In this case it will be recommended to check the maximum velocity in the pipe. For this we calculate velocity in the pipe for condition: DN 25 mm – Di 27.2 mm Dimension and condition acceptable, velocity below 1.0 m/s.

Presenting on the valve AB-QM DN 25 mm 1400/1700 = 0.82 = 82 % of nominal opening. <u>Remarks:</u> required minimum differential pressure across the AB-QM DN 25: 20 kPa.

AB-QM DN 10-250

## Pump optimising / Trouble shooting

The AB-QM (DN 10-100) features test plugs that allow measuring of the pressure difference  $\Delta$ pcv across the control valve. If the pressure difference exceeds the minimal required pressure is operational and the flow limitation is achieved. The measuring function can be used to verify if enough pressure difference is available and thus verify the flow or measure the flow directly. For detail information how to measure flow on DN 40-250 please refer to Flow checker document.

It can also be used to optimize the pump head. The pump head can be decreased until no more than the minimal required pressure is available on the most critical valve (in terms of hydronic). This optimal point is to be found when proportionality between pump head and measured differential pressure cease to exist.

Verifying the pressure can be done by using for example Danfoss PFM device (for more details please refer to AB-QM Tech Note).

Danfoss

## Data sheet AB-QM DN 10-250

Presetting

The calculated flow can be adjusted easily without using special tools.

To change the presetting (factory setting is 100 %) follow the four steps below:

- ① Remove the blue protective cap or the mounted actuator
- ② Raise the grey pointer
- 3 Turn (clock wise to decrease) to the new presetting
  4 Press grey pointer back into lock position.
  - After click presetting is locked.

The presetting scale indicates values from 100 % flow to 0 %. Clock wise turning would decrease the flow value while counter clock wise would increase it.

If the valve is a DN 15 then the nominal flow = 450 l/h = 100 % presetting. To set a flow of 270 l/h you have to set: 270/450 = 60 %.

Danfoss recomends a presetting/flow from 20 % to 100 %. Factory presetting is 100 %.

AB-QM DN 10-250

## Presetting (continuous)

#### Service

#### DN 10-32

For the service shut off function, it is recommended to install the valve in the supply water pipe.

Valves are equipped with plastic protection cap. When closing against higher differential pressure please use accessory - shut-off & protection piece (003Z1230) or set the value to 0 %.

#### DN 40-100

For the service shut-off function, the valve can be installed in either supply or return pipe.

Valves are equipped with manual shut-off for isolating function up to 16 bar.

#### DN 125-250

For the service shut-off function, the valve can be installed in either supply or return pipe.

For shut-off set the valve to 0%.

#### Installing

AB-QM valve is mono-directional meaning that the valve operates when arrow on the valve body is aligned with flow direction. When this rule is disobeyed the valve acts like variable orifice that cause water hammer at sudden closing when available pressure has increased or valve have been set to lower value.

In case when system condition allows backflows it is strongly recommended to use backflow preventer in order to avoid possible water hammer that can damage the valve as well as other elements in the system.

## Data sheet AB-QM DN 10-250

#### **Tender text**

The pressure independent balancing and control valve which means that the control characteristic is independent from the available pressure. The precise flow control performance of the AB-QM with a Danfoss actuator provides increased comfort and superior Total Cost of Ownership. The AB-QM ensures and control the required flow on every terminal unit and maintains Hydronic balance in the system.

AB-QM has following features:

- Flow limitation function
- Modulating below 1% of set flow, regardless of the setting,
- Authority of 1 at all settings
- Able to close against 16 bar of differential pressure.
- Linear control characteristic
- Scale in percentage of flow
- Control ratio 1:1000
- Test plugs for pump optimization and flow verification for DN 10-250. Available in the range from DN 10 250 from one supplier.
- Characteristic changed from linear to equal percentage characteristic at all sizes by adjusting actuator settings.
- Lockable setting
- Leakage rate of no visible leakage for DN 10 DN 20 in combination with recommended actuator
- Leakage of 0.05 % of the Qnom for DN 25 DN 100 in combination with recommended actuator
- Leakage of 0.01 % of the Qnom for DN 125 DN 250 in combination with recommended actuator
